1 Introduction

1.1 Purpose

The NOAA Weather Wire Service (NWWs) is a service designed to aggregate, process and disseminate text messages to NWWs users, state emergency management centers and commercial users. The NWWs is one of the most important means of disseminating weather messages.

The purpose of the replacement NWWs service is to provide a technology refresh and, most importantly, to reduce the operating costs, by combining the NWWs satellite broadcast with the NWS Satellite Broadcast Network (SBN).

2 System Description

2.1 System Overview

The NWW End User Client (EUC) is a cross-platform application that provides the ability to receive streams from two of the NWS Weather Wire data sources:

- Satellite Broadcast Network
- NOAA Weather Wire Open Interface

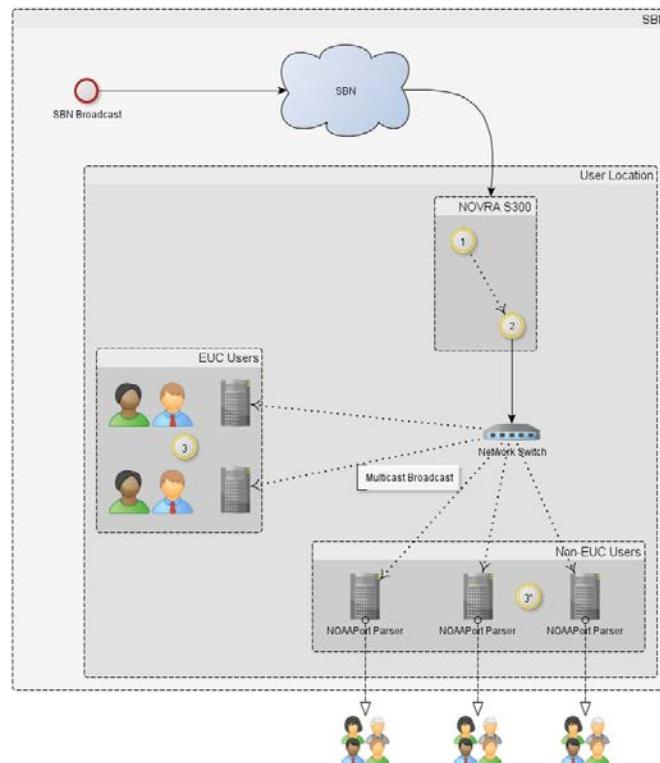

Figure 1 - EUC SBN System Architecture

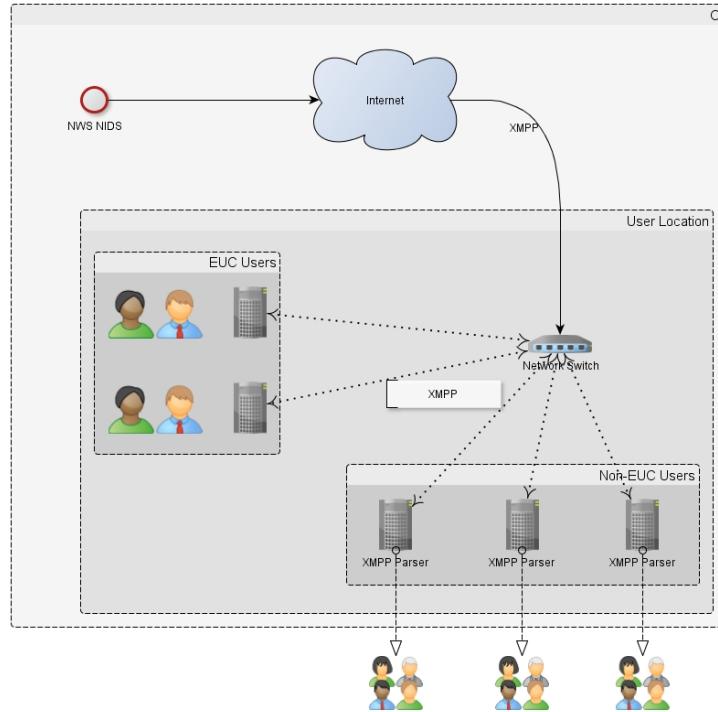

Figure 2 - EUC OI System Architecture

The streams provide NOAA Weather Wire end users with timely receipt of WMO products generated by the NWS Weather Forecast Offices and National Centers.

2.1.1 Provided Functionality

The functionality within the NWW EUC assists Emergency Managers, SBN/OI Recipients, and Weather Enthusiasts with WMO product ingest and archiving abilities. The following are the core functionalities:

- Ingest multicast WMO stream from the NWWS DVB-S2 satellite receiver
- Ingest NWWS WMO text products via XMPP
- Store (archive) all ingested WMO products for a user configurable period of up to 60 days
- Display archived WMO products based on the following filters:
 - Message Type
 - Originator
- EMWIN support

2.1.2 Host Specification

2.1.2.1 Operating Systems

- Fedora 18
- Windows 7

2.1.2.2 Disk Space

The EUC will maintain 60 days of ingested products based on the user selected filters.

Site Location	Disk Space Requirements
All	
Single Site	
Southern Region	
Western Region	
Eastern Region	
Central Region	
Pacific Region	

2.1.2.3 Memory / Process

Minimum Memory Requirement: 2 GB

Minimum Processor Requirement:

2.2 System Interfaces

The NWW EUC is capable of receiving the NOAA Weather Wire data stream from the two independent sources either in a singular or dual configuration. Both interfaces are monitored with visual status being provided within the EUC monitoring view.

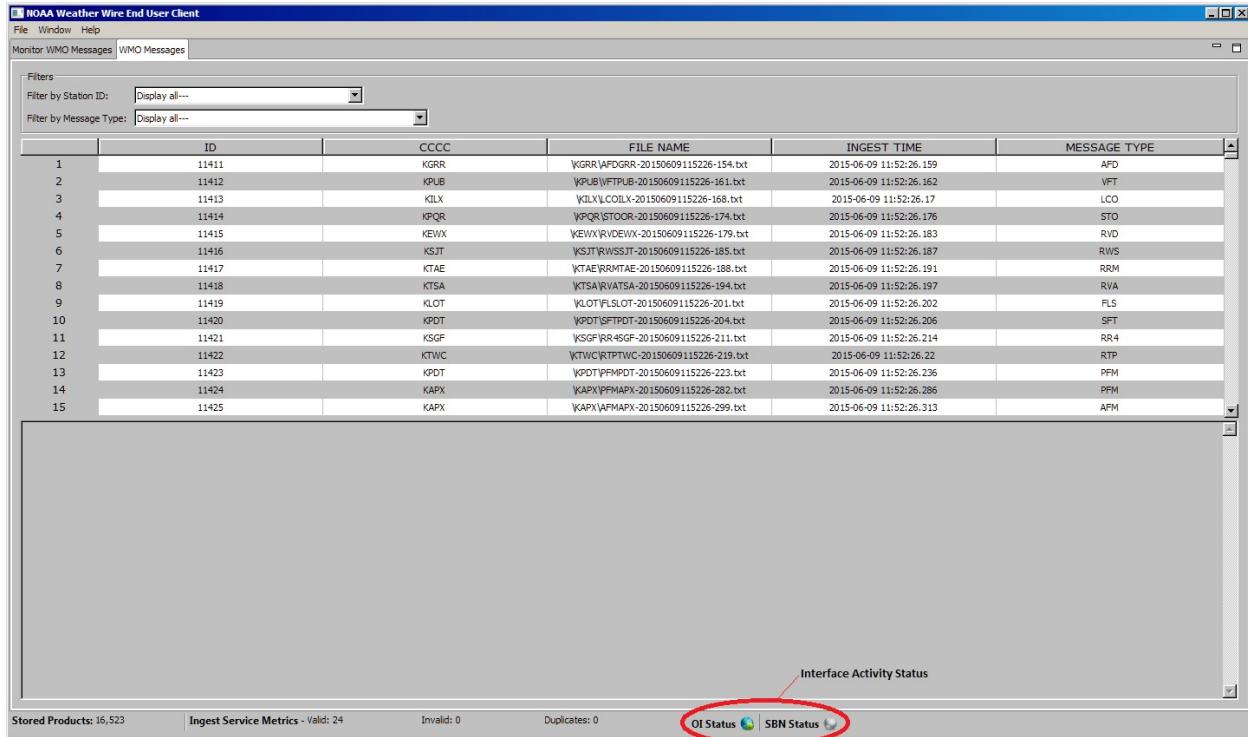

Figure 3 - Interface Activity Status

Status	Icon	Description
Active		Connected interface that is currently processing a WMO stream
Standby		Connected interface that has not received a WMO product within 5 or more minutes (automatic reconnected initiated every 3 minutes)
Inactive		Disconnected interface

The EUC will attempt several automatic reconnection attempts to provide safeguards against extended outages due to network or server issues.

2.2.1 Satellite Broadcast Network

The downlink of the NWW SBN feed provides a multicast data stream of WMO products that is regenerated from a NOVRA S300 Satellite Data Receiver. The S300 is a low cost, compact and robust data receiver that receives a DVB-S or DVB-S2 satellite signal and passes the IP or MPEG data onto your LAN. It is perfectly suited for consumer or small-medium enterprise use, delivering IP-based applications over satellite such as IPTV content delivery, weather imaging and data, distance education, digital signage, file distribution, and internet over satellite to a single computer or to a network of computers.

2.2.2 NOAA Weather Wire Open Interface

NWWS-OI provides public access to NWWS data through a simple to use web interface and RSS/ATOM feed subscriptions. The NWWS-OI deployment will contain WMO text products via RSS/ATOM subscription through the www.weather.gov URL.

3 Setup

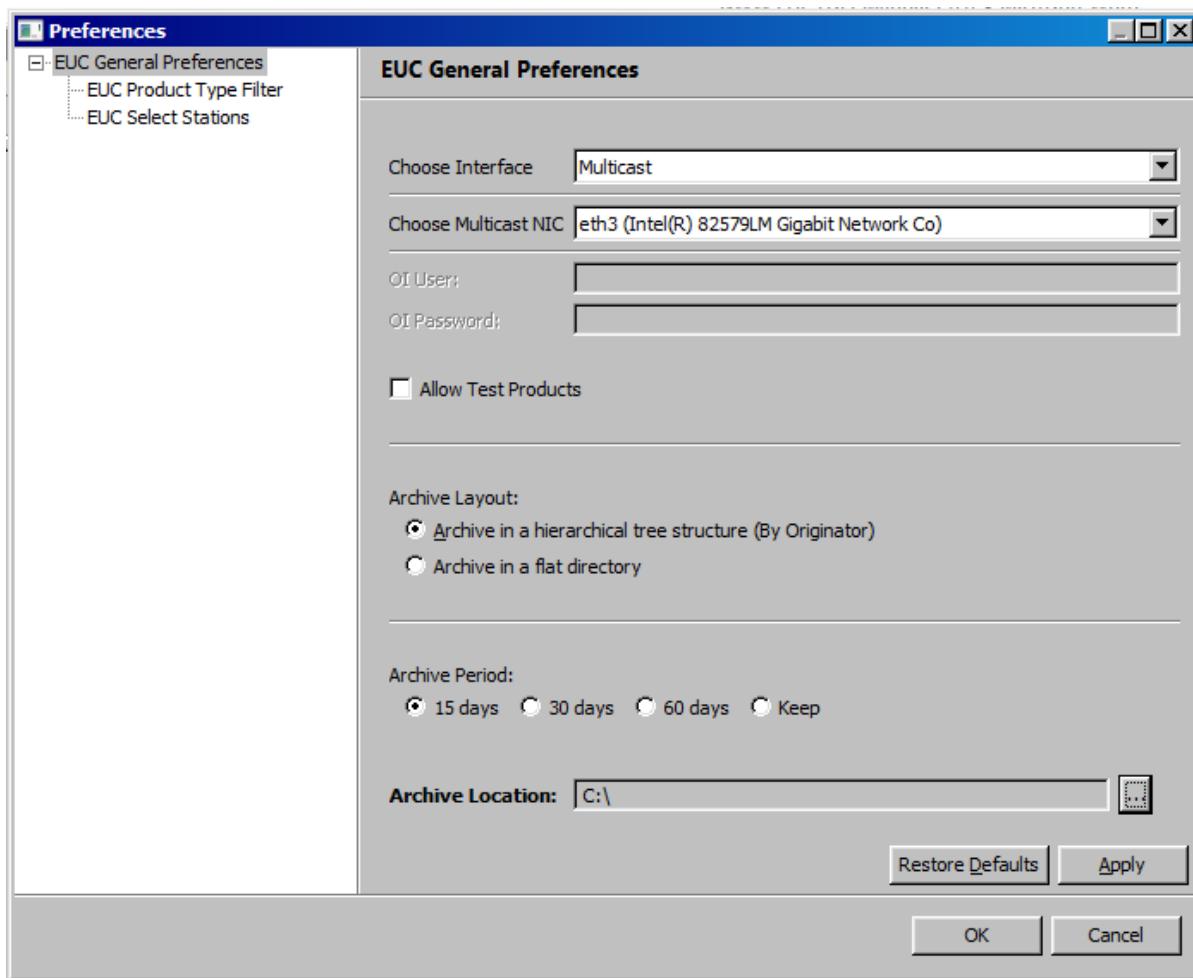

3.1 Installation

1. Unzip the provided NWW Client package that matches your system configuration into the desired directory:
 - a. nww-euc-<version>.win32.win32.x86.zip: 32-Bit Windows
 - b. nww-euc-<version>.win32.win32.x86_64.zip: 64-Bit Windows
2. Open the “nww-euc” directory and execute the file name “**nww-euc.exe**” by either double-clicking or running it from the operating system command line interface.

3.2 Configuration

3.2.1 Interface Type.

The NWW EUC is designed to provide users with the ability to segregate the SBN or OI traffic into individual subnets. For the EUC to operate properly the application must be provided with the correct network interface value for both SBN and OI connections.

1. Click Window | Preferences | EUC General Preferences
2. On the Interface Type preference, select the Multicast or the Open Interface option for a single feed or the Dual option to consume products from both interfaces simultaneously. Additional settings needed by each interface will be enabled once an option is selected. For example: If the Multicast option is selected, the Multicast NIC combo box containing the available NIC cards for the system will be enabled. The multicast NIC preference allows the user to choose what NIC card used to establish the connection with the NWW SBN. There is no default value for this preference; a card must be selected for a successful connection. If Dual mode is selected, both the multicast NIC combo box and the Open Interface username/Password boxes will be enabled.

3. Indicate whether you would like to allow test products to be displayed / archived by checking the checkbox.
4. Click Apply.

3.2.2 Archive Layout.

The Archive Layout provides two options for archiving the messages. The hierarchical tree structure is the default option and archives messages according to message originator. The flat directory option is provided primarily for EMWIN support.

1. Select the Archive Layout preference that will be used to archive the WMO messages.
2. Click Apply.

3.2.3 Archive Period.

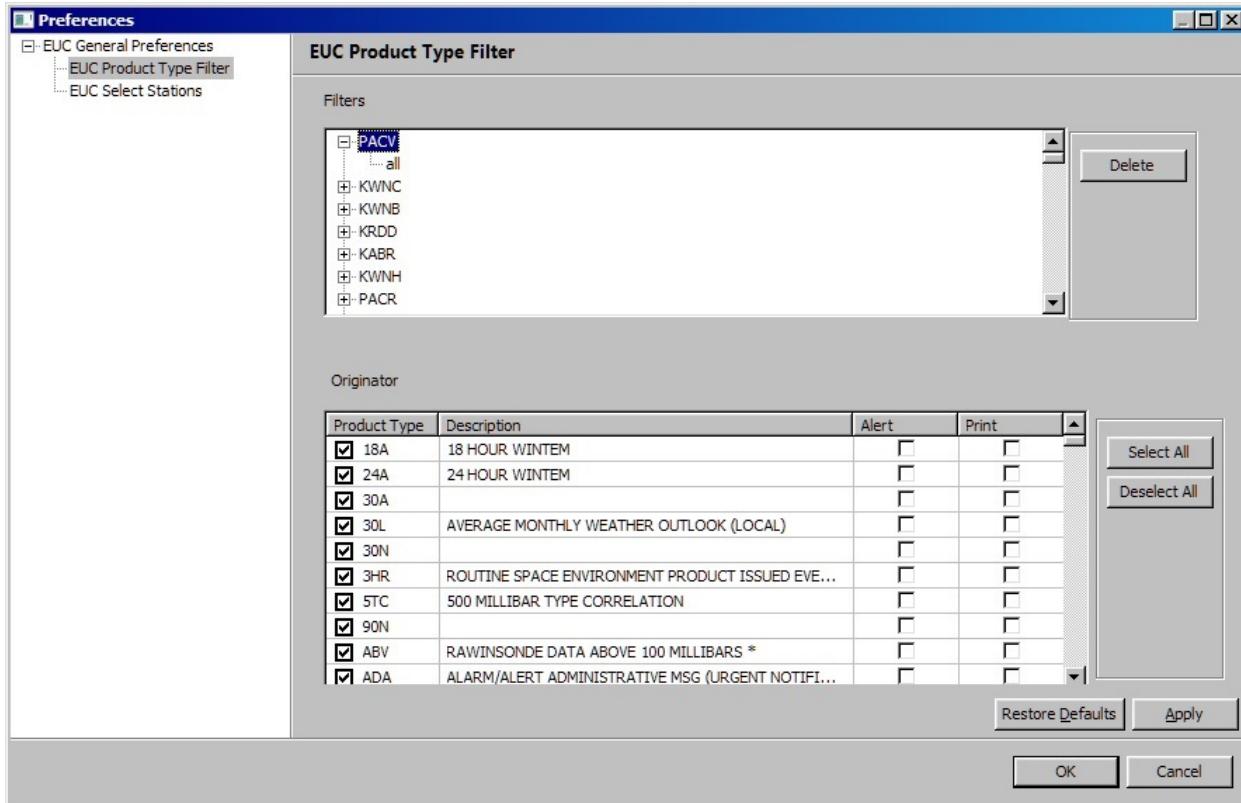

The Archive Period configuration determines how long messages are archived in the system. The default value is 60 days. Once messages are older than this setting, they are removed from the Database and the file system. The cleaning task requires that new messages are not being ingested at the time it runs. It will be cancelled /rescheduled if a new message is received. If messages need to be saved longer than 60 days, the *keep* option should be selected. Keep in mind that this may result in filling up the hard drive eventually unless the products are not manually moved or deleted.

1. Select the archive period.
2. Click Apply.

3.2.4 Archive Location.

The Archive location configuration provides an option to select an alternative directory for storing products. It will default to the EUC installation directory but it can be changed by clicking the button to the right of the *Archive Location* section.

3.2.5 Product Category Selection

This preference provides the user with the ability to choose the product categories (NNN) to set the product type filter that will be used to ingest and archive the WMO messages. In addition users are able to configure the EUC to alert and/or print select product types that are received from an originating office. Only messages with product categories selected on this page would be processed.

1. Click on the EUC Product Type Filter Page
2. Select the desired originator to populate the Product Type table
3. Configure the desired product categories for archiving in addition to alert and/or print:
 - a. Click the check-box under the “Product Type” column for all products that require archiving
 - b. To alert on a desired product click the associated check-box under the “Alert” column
 - c. For product Print capabilities click the associated check-box under the “Print” column
4. Click Apply.

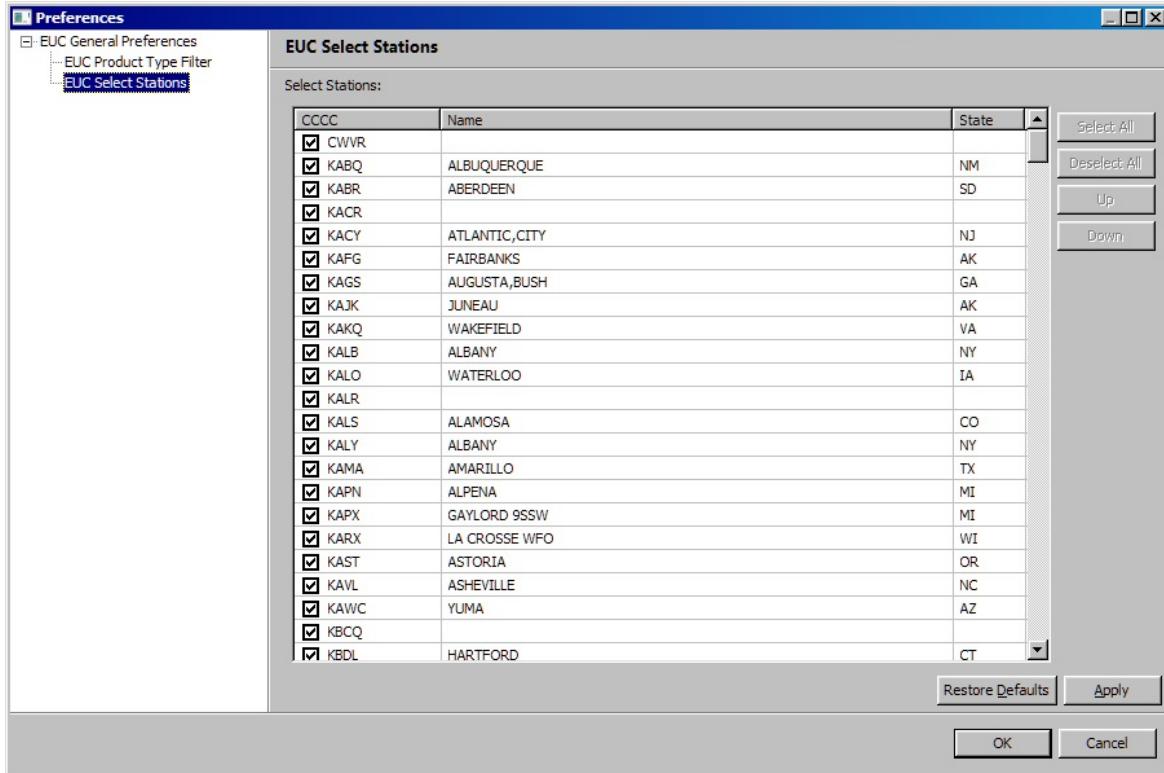

Note: The EUC “Print” feature utilizes the Windows Default Printer as the designated device for scheduling print jobs.

To select a default printer:

- Open Devices and Printers by clicking the Start button Picture of the Start button, and then, on the Start menu, clicking Devices and Printers.

- Right-click the printer you want to use, and then click Set as default printer. (You'll see a check mark on the printer's icon signifying that it's now your default printer.)

3.2.6 Station Selection

This preference provides the user with the ability to choose the stations/originator (CCCC) to set the station filter that will be used to ingest and archive the WMO messages. Originators selected on this page will have an initial Product Type filter of "ALL". See section 3.2.4 – "Product Category Selection" for information regarding tailoring products archived based on originator.

1. Click on the EUC Select Stations. To set this preference, click on any part of the table to activate the buttons to the right of the table. Click Apply once the desired stations have been selected.
2. Click OK to close the preference dialog.

4 Reference Guide

4.1 Capabilities

4.1.1 SBN Product Ingest

Ingest multicast WMO stream from the NWWS DVB-S2 satellite receiver. The products are parsed, validated, and finally stored to the database and file system.

4.1.2 OI Product Ingest

Ingest OI NWWS WMO text products via XMPP

4.1.3 Dual Product Ingest

Ingest products from both feeds simultaneously.

4.1.4 Product Archiving

Store (archive) all ingested WMO products for a user configurable period of up to 60 days.

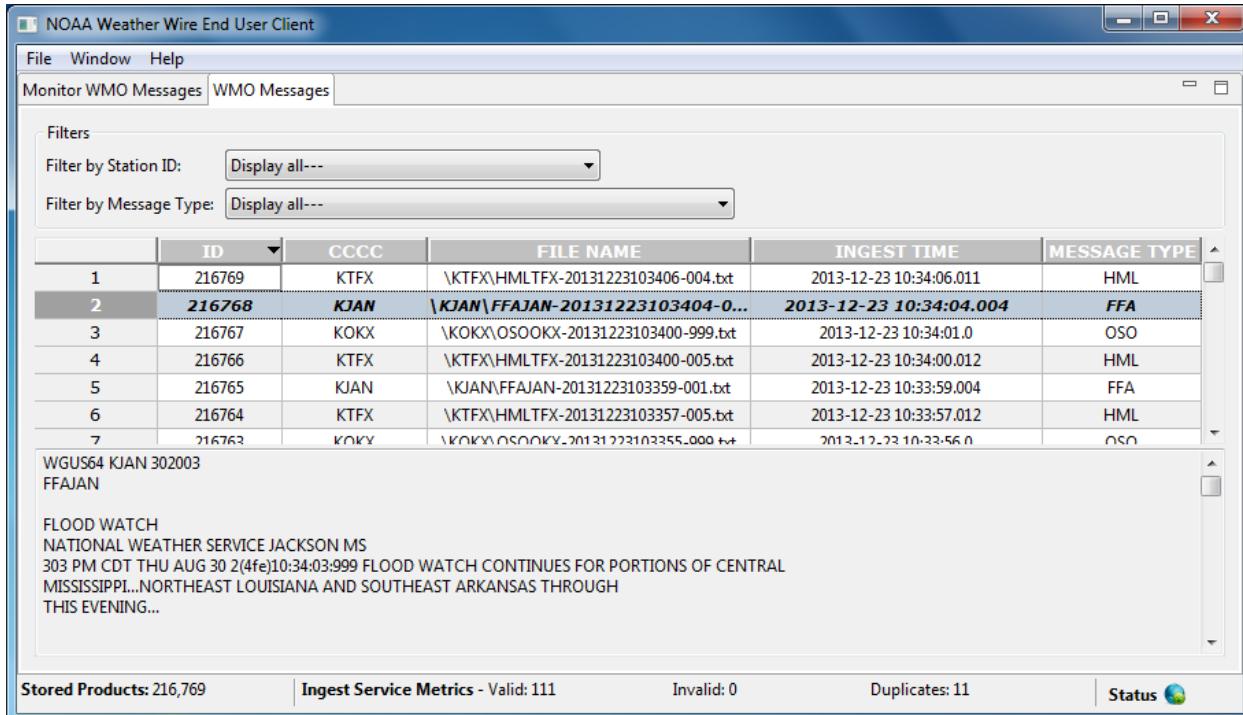

4.1.5 Product Filtering

The “Product Filtering” capability within the EUC provides a user with the ability to display archived WMO products based on the following criteria:

- Message Type
- Originator
- Test product status

4.1.6 EMWIN Support

4.2 Operating Procedure

1. Make sure the NWW-EUC application has been configured.
2. If the application is closed, open the "nww-euc" directory and execute the file name "**nww-euc.exe**" by either double-clicking or running it from the operating system command line interface.
3. Once messages are received they are:
 - a. Displayed as text within the "Monitor WMO Messages" tab
 - b. Displayed in a table format within the "WMO Messages" tab.
 - c. Archived to the DB.
 - d. Archived to the file-system within the directory titled "WMO_Archive"
 - i. Linux: located within home directory
 - ii. Windows: located within execution directory
4. The EUC application has a status bar at the bottom of the window to display:

- a. Valid messages count.
 - b. Invalid messages count. Messages could be marked as invalid if they are incomplete messages due to missing packets or if they do not meet the AWIPS Specification.
 - c. Duplicate messages count. Messages are marked as duplicate if they are identical (header and content) over a two-minute window. Duplicates messages could be received if neighboring WFOs share a common broadcast area (NWR) or when issues during SBN broadcast force product re-transmission.
 - d. Status. Connection status for SBN and OI interfaces.
5. To filter messages by Station ID:
- a. Click the WMO Messages tab.
 - b. Click on the Filter by Station ID combo box arrow to display the list of Stations containing: Station ID, Station name, and Station state.
 - c. Select one of the stations to only display messages originated by the selected CCCC id.
6. To filter messages by Message Type:
- a. Click the WMO Messages tab
 - b. Click on the Filter by Message Type combo box arrow to display the list of message types containing: Type, and Description.
7. To display the message content:
- a. Click on the WMO Messages tab. On the message table, select the desired message by clicking on the index cell (the leftmost column) for that row. The message content will be displayed on the text box below the table.

7 Appendix C - Troubleshooting

	Error	Solution
1	NWW-EUC application will not run when the nww-euc.exe file is double-clicked. The following message error might be	This error is usually generated for lack of system resources due to the inability of the Windows OS to allocate

	displayed: 	contiguous RAM on a particular workstation. Follow these steps to fix it: -Close NWW-EUC windows -Open file <installDirectory>\nww-euc-0.0.6a\nww-euc\nww-euc.ini -Locate and change the value for max heap size to allocate by changing -Xmx1536m to -Xmx1024m . -Close the file and run the nww-euc.exe file again.
